**Leroy:**

**We need to look at it in the morning, but I will likely need the following:**

- 1. A vacuum truck to remove some oily material off of a ponded area in the back of the property and place in one of the Frac Tanks;**
- 2. Remove water from the ponded area to be placed on the front quarter of the property;**
- 3. Place silt fencing and absorbent boom to try to limit potentially contaminated sediment from going into the ponded area in the back;**
- 4. Begin the process of removing building water sources off the property;**
